

## Department of Computer Engineering

**Batch:E2**

**Roll No.: 16010123325**

**Experiment No. 01**

**Grade: AA / AB / BB / BC / CC / CD /DD**

**Signature of the Staff In-charge with date**

### **TITLE: Exploring basic Commands of UNIX: Shell, Processes, Files**

**AIM:** To Explore basic commands for handling File system under Unix/Linux using shell scripts.(Creating groups, chown , chmod , directory name, tty , diff, umask).

---

#### **Expected Outcome of Experiment:**

**CO 1.** To introduce basic concepts and functions of operating systems.

---

#### **Books/ Journals/ Websites referred:**

1. **Silberschatz A., Galvin P., Gagne G. "Operating Systems Principles", Willey Eight edition.**
2. **Achyut S. Godbole , Atul Kahate "Operating Systems", McGraw Hill Third Edition.**
3. **Sumitabha Das " UNIX Concepts & Applications", McGraw Hill Second Edition.**

---

#### **Pre Lab/ Prior Concepts:**

An operating system (OS) is a resource manager. It takes the form of a set of software routines that allow users and application programs to access system resources (e.g. the CPU, memory, disks, modems, printers network cards etc.) in safe efficient and abstract way.

- The operating system kernel is in direct control of the underlying hardware. The kernel provides low-level device, memory and processor management functions (e.g. dealing with interrupts from hardware devices, sharing the processor among multiple programs, allocating memory for programs etc.)
- Basic hardware-independent kernel services are exposed to higher-level programs through a library of system calls (e.g. services to create a file, begin execution of a program, or open a logical network connection to another computer).
- Application programs (e.g. word processors, spreadsheets) and system utility programs (simple but useful application programs that come with the operating system, e.g. programs which find text inside a group of files) make use of system calls. Applications and system utilities are launched using a shell (a textual command line interface) or a graphical user interface that provides direct user interaction.

## **Department of Computer Engineering**

Operating systems can be distinguished from one another by the system calls, system utilities and user interface they provide, as well as by the resource scheduling policies implemented by the kernel.

UNIX has been a popular OS for more than two decades because of its multi-user, multi-tasking environment, stability, portability and powerful networking capabilities.

Linux is a free open source UNIX OS for PCs.

Linux has all of the components of a typical OS :

- **Kernel**

The Linux kernel includes device driver support for a large number of PC hardware devices (graphics cards, network cards, hard disks etc.), advanced processor and memory management features, and support for many different types of file systems. In terms of the services that it provides to application programs and system utilities, the kernel implements most BSD and SYSV system calls, as well as the system calls described in the POSIX.1 specification.

The kernel (in raw binary form that is loaded directly into memory at system startup time) is typically found in the file /boot/vmlinuz, while the source files can usually be found in /usr/src/linux.

- **Shells and GUIs**

Linux supports two forms of command input: through textual command line shells similar to those found on most UNIX systems (e.g. sh - the Bourne shell, bash - the Bourne again shell and csh - the C shell) and through graphical interfaces (GUIs) such as the KDE and GNOME window managers.

- **System Utilities**

Virtually every system utility that you would expect to find on standard implementations of UNIX has been ported to Linux. This includes commands such as ls, cp, grep, awk, sed, bc, wc, more, and so on. These system utilities are designed to be powerful tools that do a single task extremely well (e.g. grep finds text inside files while wc counts the number of words, lines and bytes inside a file). Users can often solve problems by interconnecting these tools instead of writing a large monolithic application program.

- **Application programs**

Linux distributions typically come with several useful application programs as standard. Examples include the emacseditor, xv (an image viewer), gcc (a C compiler), g++ (a C++ compiler), xfig (a drawing package), latex (a powerful typesetting language) and soffice (StarOffice, which is an MS-Office style clone that can read and write Word, Excel and PowerPoint files).

---

### **Description of Unix Commands and options:**

## Department of Computer Engineering

### A. Basic and Important UNIX (Linux/macOS) Commands

1. Directory and File Management
2. Viewing and Editing Files
3. Searching and Permissions

### B. Process and System Management

1. Process Control
2. System Information

### C. Advanced and Useful UNIX Commands

1. Administrative and Remote Operations
2. Searching and Processing Files
3. System Monitoring and Disk Management

### **Screen Shot of Implemented Commands:**

```

kjsce@kjsce-VirtualBox:~$ mkdir notes
kjsce@kjsce-VirtualBox:~$ ls
191   city.txt  Downloads  file3.txt  Pictures  Templates
a.txt  Desktop    file1.txt  Music      Public    Videos
b.txt  Documents  file2.txt  notes     snap
kjsce@kjsce-VirtualBox:~$ ls *.txt
a.txt b.txt city.txt  file1.txt  file2.txt  file3.txt
kjsce@kjsce-VirtualBox:~$ cd Music
kjsce@kjsce-VirtualBox:~/Music$ cd notes
bash: cd: notes: No such file or directory
kjsce@kjsce-VirtualBox:~/Music$ cd ../
kjsce@kjsce-VirtualBox:~/Music$ cd notes

## **Department of Computer Engineering**

### **Conclusion:**

This experiment provided a hands-on introduction to basic UNIX/Linux commands, focusing on file management, process control, and system operations. By using commands like chown, chmod and chgrp we gained practical experience in managing files and permissions. The knowledge acquired will help in efficiently administering UNIX/Linux systems and performing essential tasks like file handling, system monitoring, and process management. This foundation is essential for anyone working in a UNIX environment.

### **Post Lab Multiple Choice Questions**

1. What does the -r option do when used with the rm command?

- a) Removes files recursively
- b) Removes files forcefully
- c) Removes files interactively
- d) Removes files silently

**Answer: Removes files recursively**

2. Which command is used to move a file from one location to another?

- a) cp
- b) mv
- c) rm
- d) touch

**Answer: mv**

3. What is the purpose of the -n option in the cat command?

- a) Displays the file contents in reverse order
- b) Displays the file contents with line numbers
- c) Displays the file contents in uppercase
- d) Displays the file contents in lowercase

**Answer: Displays the file contents with line numbers**

4. Which command is used to search for a specific pattern in a file?

- a) find
- b) grep
- c) locate
- d) chmod

**Answer: grep**

## Department of Computer Engineering

### **Post Lab Descriptive Questions**

1. Explain how do you read and interpret syntax of any OS command.

- Command Name:** The instruction to execute (e.g., ls, rm).
- Options/Flags:** Modify command behavior (e.g., -r).
- Arguments:** Targets for the command (e.g., file names or directories).
- Example: ls -l /home/user
  - ls (command), -l (option), /home/user (argument).

Explain different functions of the operating systems.

- **Process Management:** Manages execution of processes.
- **Memory Management:** Allocates and manages memory.
- **File System Management:** Handles file storage and retrieval.
- **Device Management:** Manages hardware devices.
- **Security:** Controls access and authentication.

2. • **User Interface:** Provides command-line or graphical interface.

3. What are the default permissions assigned by Unix for Directory.

In UNIX, when a directory is created, it has default permissions of **755**:

- **Owner:** Read (r), Write (w), Execute (x) — Full access.
- **Group:** Read (r), Execute (x) — Can list and access the directory but cannot modify it.
- **Others:** Read (r), Execute (x) — Can list and access the directory but cannot modify it.

In numeric terms, this is represented as:

- **7** (Owner) = Read (4) + Write (2) + Execute (1)
- **5** (Group) = Read (4) + Execute (1)
- **5** (Others) = Read (4) + Execute (1)

Thus, the default permission for a directory is **755**, which allows full access to the owner, and read/execute access to group members and others.
