

Batch: C3 Roll No.: 16010123325
Experiment No. 4
Grade: AA / AB / BB / BC / CC / CD / DD

Title: Host a Static Website using Amazon S3

Objective:

In this lab, students will:

- Create an S3 bucket
- Upload a static website file
- Enable static website hosting
- Configure public access using bucket policy
- Access the hosted website

Expected Outcome of Experiment:

CO	Outcome
	Learn static website hosting on cloud using AWS S3

Books/ Journals/ Websites referred:

- Official documentation of Amazon Web Services
- AWS S3 User Guide (docs.aws.amazon.com)
- Cloud Computing Concepts by Rajkumar Buyya

Abstract:-

This experiment demonstrates how to host a static website using Amazon S3. A bucket is created to store website files, and static hosting is enabled to make the content accessible over the internet. Public access permissions are configured using bucket policies. The website is then accessed via a generated endpoint URL. This lab provides practical understanding of deploying simple web applications using cloud storage services.

Related Theory: -

Amazon S3:

Amazon S3 is an object storage service used to store and retrieve data. It can also be used to host static websites by serving HTML, CSS, and JavaScript files.

Static Website Hosting:

Static websites consist of fixed content (HTML, CSS, JS) and do not require server-side processing. S3 can host such websites directly without needing a backend server.

Bucket Policy:

Bucket policies are JSON-based access control rules. They allow or restrict access to S3 resources. In this lab, a public read policy is used to make the website accessible to everyone.

Website Endpoint:

When static hosting is enabled, S3 provides a unique URL (endpoint) through which the website can be accessed.

Public Access Configuration:

To host a website, public access must be enabled so users can view the content over the internet.

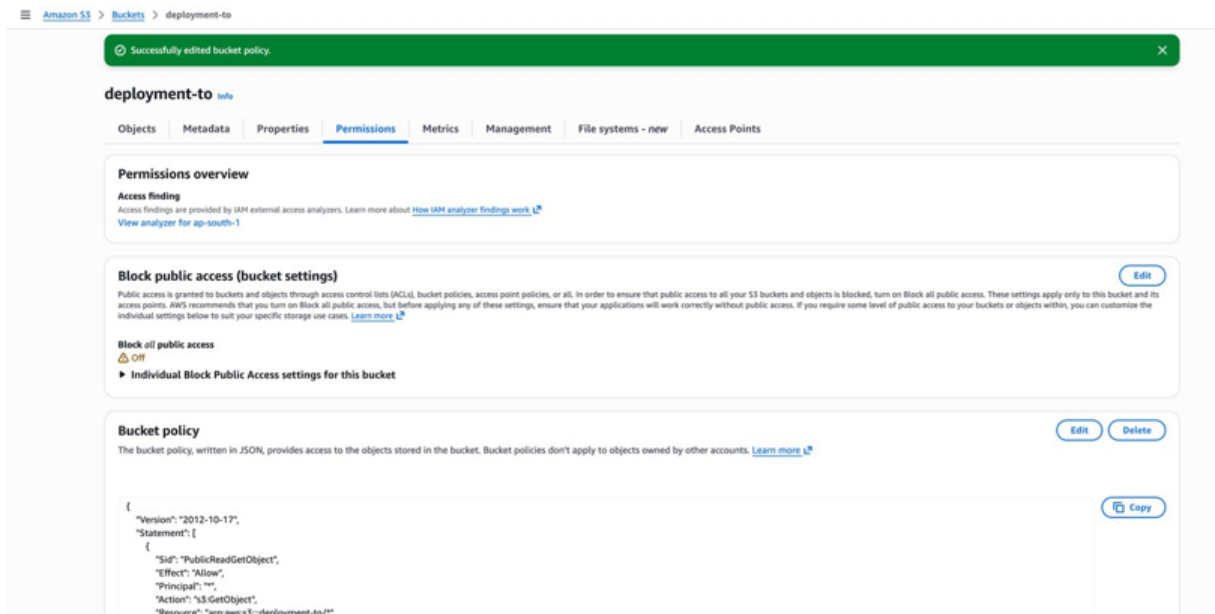

Implementation Details:

Step 1: Login to AWS

- Open AWS Console and log in
- Select region: Asia Pacific (Mumbai)

Step 2: Create S3 Bucket

- Open Amazon S3
- Click **Create bucket**
- Enter unique bucket name
- Disable block public access
- Create bucket

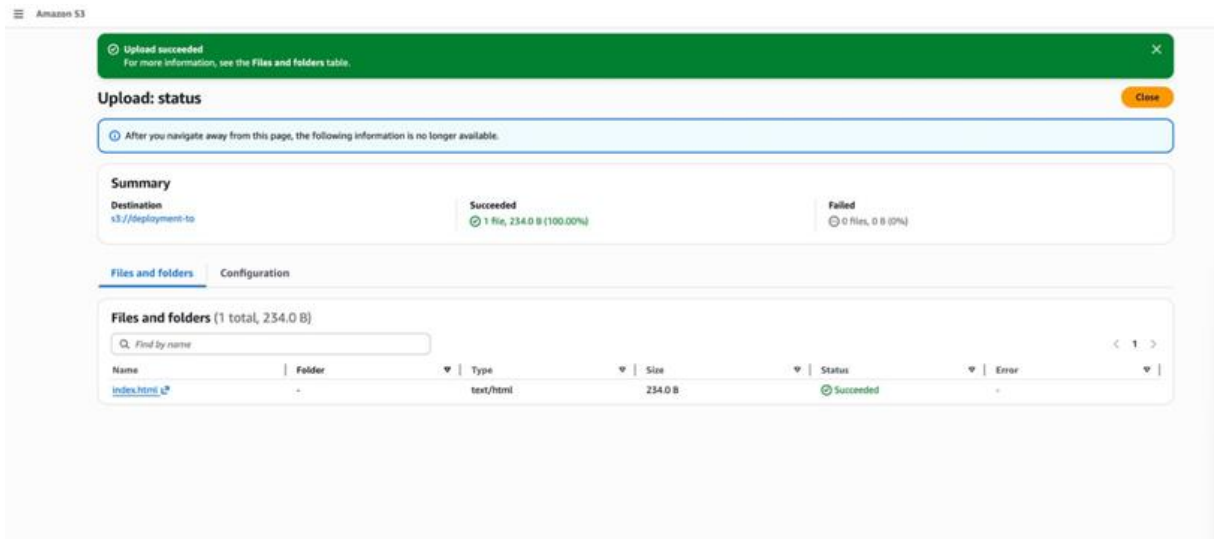

Step 3: Create Website File

- Create an index.html file
- Add basic HTML content
- Save the file

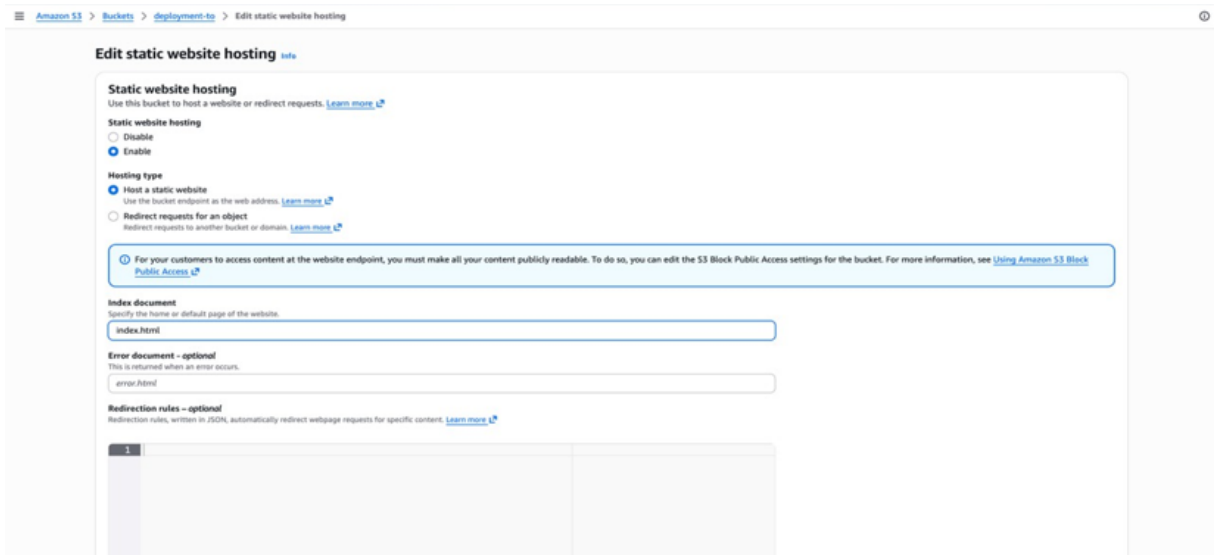

Step 4: Upload File

- Open bucket → Click **Upload**
- Add index.html
- Upload file

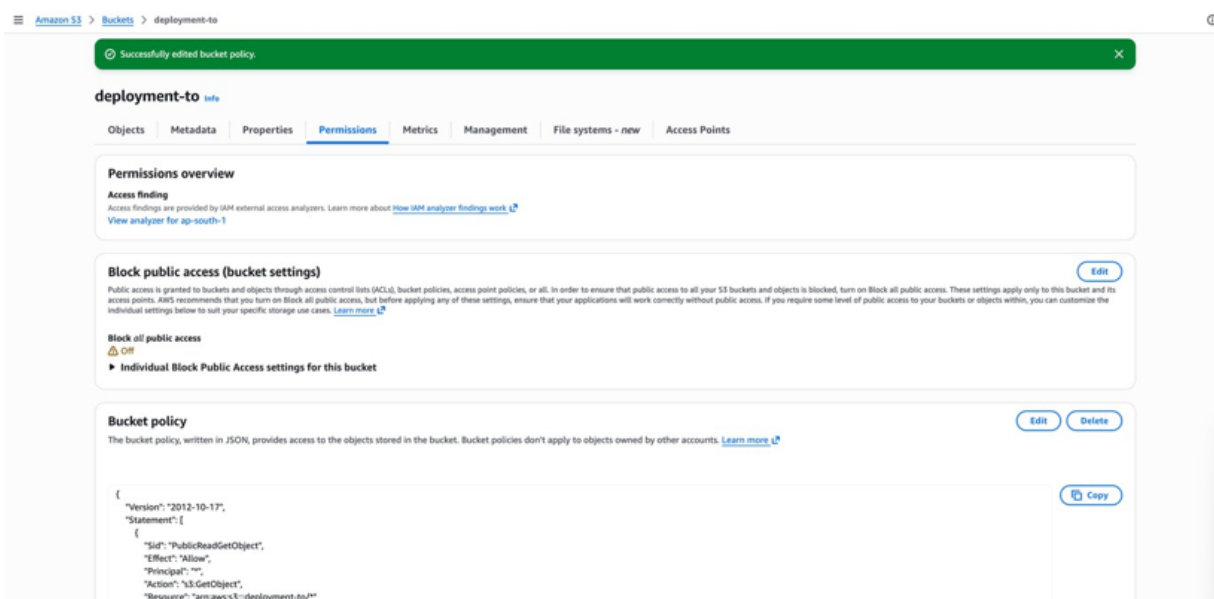

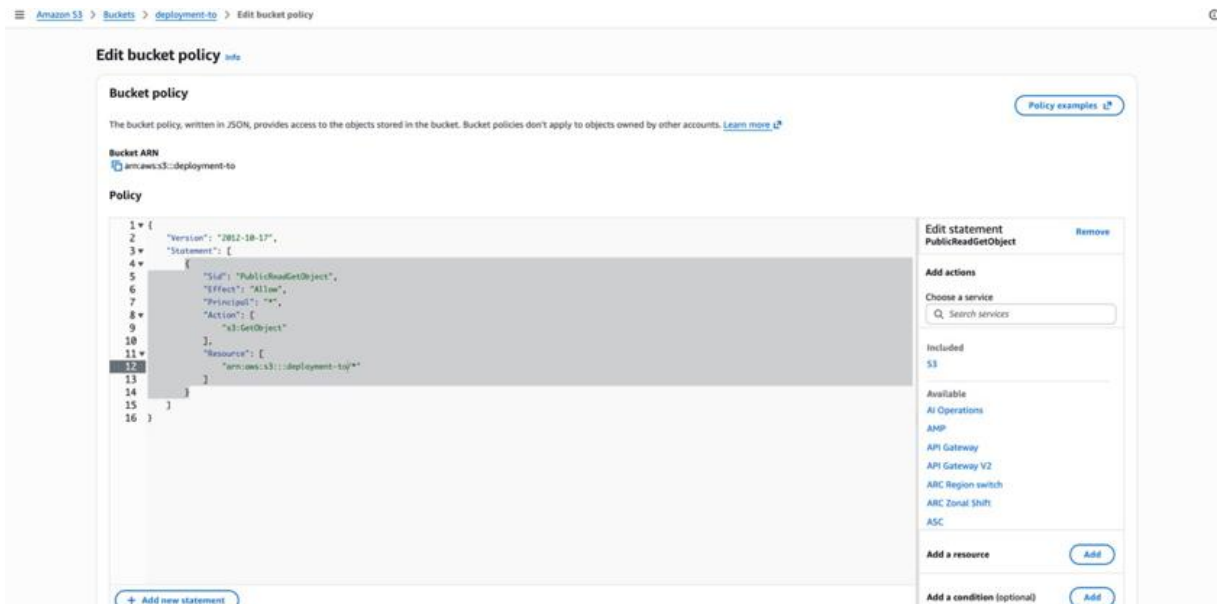

Step 5: Enable Static Website Hosting

- Go to **Properties**
- Enable static website hosting
- Set index document as index.html

Step 6: Configure Bucket Policy

- Go to **Permissions**
- Add public read policy
- Save changes

Step 7: Access Website

- Copy the **bucket website endpoint URL**
- Open it in browser

Step 8: Verify Website

- Check if webpage loads successfully
- You should see the hosted content

Welcome to My AWS S3 Static Website

This website is hosted on Amazon S3 - SEEYUH

Conclusion:-

This experiment demonstrated how to host a static website using Amazon S3 by configuring storage, enabling hosting, and setting public access permissions.
